

This project was developed as a freelancing portfolio project using Power BI.

SALES ANALYTICS REPORT

Sales Dashboard Analysis Project

Prepared by: ABHISHEK CHATTERJEE

Tool: Power BI | Type: Freelancing Portfolio Project

Date: June 2026

1. Project Objective

The objective of this project is to analyse sales data and build an interactive dashboard to understand business performance, product trends, and customer behaviour.

2. Tools Used

- Power BI — Primary tool for data visualization and dashboard creation
- DAX (Data Analysis Expressions) — Used for calculated measures and KPIs
- Data Cleaning & Transformation — Performed to ensure data accuracy and consistency

3. Dataset Overview

The dataset contains sales-related information including order details, customer information, product categories, and shipping data.

Columns Used:

- Order ID — Unique identifier for each transaction
- Order Date — Date on which the order was placed
- Customer Details — Information about the customer
- Category & Sub-Category — Product classification hierarchy
- Sales — Revenue generated per order
- Region — Geographical area of the sale

4. KPIs Created

The following Key Performance Indicators (KPIs) were created using DAX measures to track overall business performance at a glance:

KPI Name	Description
Total Sales	Sum of all revenue generated across all orders and regions
Total Orders	Count of distinct Order IDs representing total transactions
Average Sales per Order	Total Sales divided by Total Orders — measures per-order performance

5. Visualizations Created

The following visualizations were developed in Power BI to provide comprehensive insight into sales performance:

- **Sales Trend (Monthly Line Chart)** — Displays month-over-month revenue fluctuations to identify seasonal patterns and growth trends.
- **Top 5 Products by Sales** — Bar chart ranking the highest-revenue products, enabling quick identification of best-sellers.
- **Sales by Category** — Donut/pie chart showing the revenue contribution breakdown across major product categories.
- **Sub-Category Analysis** — Horizontal bar chart providing a granular view of performance at the sub-category level.
- **Regional Performance** — Map and slicer-enabled visuals allowing dynamic filtering by region for localized performance review.

6. Key Insights

The following insights were derived from the Power BI dashboard analysis:

- Identified top-performing products contributing maximum revenue — A small set of products consistently drove the majority of total sales, confirming a Pareto-like distribution in product performance.
 - Sales trend analysis showed monthly fluctuations — Revenue displayed noticeable peaks and troughs throughout the year, suggesting the influence of seasonal demand or promotional activity.
 - Category-wise breakdown helped understand business distribution — Certain categories dominated revenue contribution, providing clear guidance on where to focus inventory and marketing efforts.
 - Interactive filters allow dynamic data exploration — Regional slicers enabled stakeholders to drill down into location-specific performance without navigating between multiple reports.
 - Sub-category analysis revealed hidden performance gaps — While top-level categories appeared balanced, sub-category data exposed underperforming segments requiring attention.
-

7. Conclusion

This dashboard helps stakeholders make data-driven decisions by providing clear insights into sales performance, product trends, and customer segmentation. By combining interactive visualizations with well-defined KPIs, the project demonstrates a practical approach to business intelligence — translating raw sales data into actionable intelligence that supports strategic planning, resource allocation, and performance monitoring.

The skills applied in this project — data cleaning, DAX measure creation, and visual storytelling — reflect real-world freelancing competencies that can be directly applied to client engagements across retail, e-commerce, and supply chain domains.
